

**Task:**

Implement a simple web app that allows one to browse the Imgur gallery using <https://api.imgur.com/>:

- show [gallery images](#) in a grid of thumbnails;
- show image description in the thumbnail, top or bottom;
- allow selecting the gallery section: hot, top, user;
- allow including / excluding viralimages from the result set;
- allow specifying window and sort parameters;
- when clicking an image in the gallery - show its details: big image, title, description, upvotes, downvotes and score.

**Bonus points:**

- instead of calling Imgur API directly, proxy the API calls through your server (ex. Express);
- use VueJS, ReactJS or similar framework, and preferably Redux.
- use plain Javascript with ES6-Features
- use OOP if possible
- use BEM-Methodology
- make the App Accessable for anyone
